9C Lesson 1

Threat from disease

Year 9 Science · 9C Threat from disease · Student Book pages 37 to 38

Name _____ Class _____ Date _____

Today I can:

- ☐ I can explain how hygiene, diet, immunisation and medicines have helped people live longer.
- ☐ I can give examples of the five types of disease and say which ones can be passed from person to person.

Key words

disease something that makes you ill
pathogen a microorganism that causes disease
infectious disease a disease caused by a pathogen that can pass from person to person (communicable)
non-communicable cannot be passed from person to person
deficiency disease a disease caused by a lack of a nutrient in the diet
genetic disease a disease caused by a fault in the DNA
lifestyle disease a disease made more likely by the way we live, e.g. smoking
autoimmune disease a disease in which the body's own white blood cells attack it
symptom an obvious effect of a disease, e.g. a rash
hygiene keeping things clean so pathogens do not spread
immunisation giving a vaccine to protect against a disease

● Core Everyone does this section.

1. Match each type of disease to its example. Draw a line.

deficiency disease	type 1 diabetes: white blood cells destroy cells in the pancreas
infectious disease	flu, caused by the flu virus
lifestyle disease	scurvy, caused by a lack of vitamin C in the diet
genetic disease	lung cancer linked to smoking tobacco
autoimmune disease	sickle cell disease, inherited from the parents

2. Tick one box in each row to show whether the disease is communicable (can be passed on) or non-communicable.

Disease	Communicable	Non-communicable
cholera (bacterium in dirty water)		
anaemia (too little iron in the diet)		
chickenpox (virus)		
cardiovascular disease (heart and blood vessels)		
malaria (protoctist carried by mosquitoes)		
haemophilia (inherited)		

3. Complete the sentences using words from the word bank.

Pathogens are _____ that cause disease.

Keeping drinking water separate from _____ is an example of good _____.

_____ with a vaccine protects a person against a particular disease.

The obvious effects of a disease, such as a rash, are its _____.

4. Anaemia is a disease caused by food that does not contain enough iron. Tick the type of disease that anaemia is.

- ☐ A deficiency disease
- ☐ B infectious disease
- ☐ C lifestyle disease
- ☐ D genetic disease

●● Stretch When Core is finished.

S1. Define each word in one sentence.

a) pathogen

b) hygiene

c) immunisation

S2. The polio virus damages nerves that carry signals to muscles. Explain why this can stop a person moving their legs.

S3. The text says polio affected 'an estimated half a million people' a year. Explain what 'estimated' means here and why an exact number was not possible.

●●● Challenge Explain in full sentences.

C1. In richer countries, most deaths are now caused by non-communicable diseases rather than by infections. Explain why this has changed since the 1840s. Use the words hygiene, immunisation and lifestyle in your answer.

C2. Medicines taken by mouth are absorbed into the blood and then enter cells by diffusion. Explain how diffusion happens, using ideas about particles.

My thinking (any language)

Which has saved more lives: clean water or medicines? What information would you need to decide?

Word bank pathogen · microorganisms · sewage · hygiene · immunisation · symptoms · infectious · non-communicable · deficiency · lifestyle

Exit ticket 9C Lesson 1: Threat from disease Name _____

1. What is a pathogen?

2. Give one example of a non-communicable disease and explain why it is non-communicable.

3. Name two types of microorganism that can be pathogens.

Today I can: Goal 1 ☐ Goal 2 ☐
